

## PORT STATE CONTROL INSPECTION PREPARATION

The main objective of Port State Control is to establish a global safety net to identify and eliminate substandard vessels.

Port State Control Inspections are increasing year on year and with a growing emphasis on the safety of crews, vessels and environmental surroundings, these inspections are often very thorough.

Fire-Aid International will ensure your vessel and crew are ready and correctly prepared for Port State Control Inspection.

The majority of PSC deficiencies are found within the areas of safety, pollution prevention equipment and machinery.

Fire-Aid International Port State Control Inspection Preparation will include an in-depth check and audit in the following subjects:

- Fire Safety Measures
- Safety of Navigation
- Life Saving Appliances
- Load Line Fittings
- Pollution Prevention Equipment
- Propulsion and Auxiliaries

Drills will also form part of the PSC preparation to ensure the crew can competently carry out various drills on board to a suitable standard.

No vessel is free from being inspected by PSC and no vessel can escape the PSC safety net. That is why utilising Fire-Aid International PSC Inspection Preparation services will help prevent possible problems or costly detentions and delays.
